

Start and Update Method:

Start is code to execute on the very first frame, and Update executes on every frame.

Moving Left and Right:

Creating a Variable :

```
public float keyinput;
```

Taking input from Keyboard :

```
keyinput = Input.GetAxis("Horizontal");
```

*Horizontal = Left Right Arrow Keys

Providing Our Rigid Body the vector velocity in directions :

```
GetComponent<Rigidbody>().velocity = new Vector3 (x,y,z);
```

*Velocity is Speed but in a direction.

*To move left and right we will give keyinput into the x axis.

Jumping:

Adding an event when key is pressed :

```
Input.GetKeyDown(KeyCode."KEY");
```

* select any key from keyboard like for jump we can use Space as key.

Providing Our Rigid Body the vector velocity in directions :

```
GetComponent<Rigidbody>().AddForce (Direction,Type);
```

*We have to add Direction and type of force as arguments.

*Direction to jump - > Vector3.up

*Force to Jump - > ForceMode.VelocityChange
